RESULTANCE OF THE PROPERTY OF 
Use of YKL-40 and anti-YKL-40 antibodies - for developing prods. for diagnosis prognosis and therapy of diseases involving connective tissue degradation.
Disclosure; Page 66-67; 88pp; English.
YKL-40 (40 kDa) was purified from human osteosarcoma MG63 cells.
The N-terminal sequence is shown in R70745; the full coding region of the YKL-40 gene is given in 082245. Homology of the N-terminal and 2 internal peptides (R70746-47) with a bacterial polysaccharide hydrolase suggests that YKL-40 degrades polysaccharide connective tissue. YKL-40 degrades polysaccharide connective tissue. YKL-40 is a marker of e.g. metastatic breast cancer and inflammatory or degenerative joint diseases.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodm. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein has a mol wt. of 115 kD (calculated matriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Natriuretic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1: 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce MPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

                                                                                                                                                                                                                                                        E.coli beta-galactosidase. The wild type sequence was obtained as single stranded template and an oligonucleotide was hybridised to the stranded template and an oligonucleotide with the sequence at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are completed to forms that can amplified and them expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of where correct singularly in a suitable control of the control of the sequence covers all 176 difft base substitutions, most of where correct singularly in a suitable control of the sequence covers all 176 difft base substitutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           misincorporation, completion of molecules an Disclosure; p; English. Random point mutations were introduced into E.coli beta-galactosidase. The wild type seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Introducing random point mutations into nucleic acods - by prepn of single stranded template, annealing a primer, misincorporation, completion of molecules and screening.

New oligo:nucleotide probes
detection and amplification
                                                                                                                                                                                    oligonucleotide probe WK14-A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. see also Q51735-45 and Q51747-59.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PT Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing as generic DNA sequence used to generate random TSAR (Totally CO 70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be crepresented as follows: X(NNB)11(TGC)(NNB)52(NNB)10Y. X CC and Y are flanking restriction sites (X is not the same as Y) that are contained for the specific peptides generate by these generic sequences are shown in Q70466-68. CC Other specific peptides generated by these generic sequences are shown in Comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain with CC comprising at least two functional regions - a binding domain that is competite between the 2 domains. The oliquoucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs CC confers some degree of conformational rigidity to the peptides. The TSARs concentration of macromolecules, eg. metal ion, calcium the contains of post of the conformation of the context the need concolonal or polyclonal antibodies and therefore circumvent the need concolonal or polyclonal antibodies and therefore circumvent the need concolonal or polyclonal antibodies and therefore circumvent the need concolonal concolon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Random point mutations were introduced into the alpha fragment of E. coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.

PS Disclosure; Page 35, 255pp; English.
CC Q70467 is a generic DNA sequence used to generate random TSAR (Totally
CC Synthetic Affinity Reagents) peptides.This generic formula can also be
CC represented as follows: X(NNB)16(TGC)(NNB)1Z(NNB)16(TGC)(NNB)1Y. X
CC and Y are flanking restriction sites (X is not the same as Y) that are
CC not specific further. Other generic sequences are shown in Q70466-68.
CC Other specific peptides generated by these generic sequences are shown in
CC R65131-54. TSARs are concatenated heterofunctional proteins or peptides,
CC comprising at least two functional regions - a binding domain with
CC affinity for a ligand and a second effector peptide portion that is
CC chemically or biologically active. They may further comprise a linker
CC peptide between the Z domains. The oligonucleotides are also designed so
CC that the expressed peptide contains 2 or 4 cysteine residues positioned
Ci n, or flanking, the unpredicted or variant residues. These residues
CC confers some degree of conformational rigidity to the peptides. The TSARs
CC comprising a TSAR binding domain can be used in vivo to
CC deliver a chemically or biologically active moiety, eg. metal ion,
CC radioisotope, peptide, toxin or enzyme, to the specific target or on the
CC cell. They can also replace the function of macromolecules, eg.
CC complex methods of hybridoma formation or in vivo antibody production.
CC The TSARs are easily characterised and have designed activity allowing
CC direct and rapid detection in a screening process.

identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain Disclosure; Page 35; 255pp; English.

Q70469 is a generic DNA sequence used to generate random TSAR peptide This generic formula can be represented as follows: X(TGC)(NNB)10-(TGC)(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. This sequence generates peptides that are cloverleaf in structure. Other generic sequences are shown in Q70465-68. Other specific peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Generic DNA sequence to generate a random TSAR peptide library. TSAR; totally synthetic affinity reagent; synthetic; binding do effector domain; concateneated heterofunctional protein; linker direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WO9418318-A.

            PT Identifying proteins or peptide(s) which bind a ligand - by
PT screening a recombinant vector library expressing fusion proteins
PT comprising a binding domain and an effector domain
PT comprising a binding domain and an effector domain
PT comprising a binding domain and an effector domain
PT comprising a binding domain and an effector domain
PT comprising a binding domain and an effector domain
PT comprising a binding domain and an effector peace of the same as 10 be
PT comprising a binding testiction sites (X is not the same as Y) that are
PT comprising a binding restriction sites (X is not the same as Y) that are
PT comprising a binding restriction sites (X is not the same as Y) that are
PT comprising at least two functional proteins or peptides,
PT comprising at least two functional regions - a binding domain with
PT comprising at least two functional regions - a binding domain with
PT comprising a light a second effector peptide portion that is
PT comprising a binding domains. They may further comprise a linker
PT comprise a light active. They may further also designed so
PT comprise a companies of the peptide portion of that is a companies and the period of the per
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc generated by these generic sequences are shown in R65150-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and cc ascond effector peptide portion that is chemically or biologically cc The oligonucleotides are also designed so that the expressed peptide cc contains 2 or 4 cysteine residues positioned in, or flanking, the cc unpredicted or variant residues. These residues confer some degree of cc conformational rigidity to the peptides. The TSARs or compans. comprising ca TSAR binding domain can be used in vivo to deliver a chemically or cc biologically active moiety, eg. metal ion, radioisotope, peptide, toxin cc rezyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma cc characterised and have designed activity allowing direct and rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or companies comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. sequence 114 BP; 0 A; 2 C; 2 G; 2 T;
